

CARBOXYTHERAPY Now Introduced in the U.S.A. by Dr. Raphael Nach of Beverly Hills, California

CARBOXYTHERAPY is now an FDA approved cosmetic surgical treatment. Newly approved in the U.S., CARBOXYTHERAPY is a non-surgical alternative for facial and body rejuvenation with no downtime.

Beverly Hills, CA (PRWeb) December 18, 2006 -- CARBOXYTHERAPY is now an FDA approved cosmetic surgical treatment. Newly approved in the U.S., CARBOXYTHERAPY is a non-surgical alternative for facial and body rejuvenation with no downtime.

Many people only dream of having a remedy to reduce the effects of aging, with no downtime, and with minimal expense. CARBOXYTHERAPY can make that dream a reality. CARBOXYTHERAPY works by injecting carbon dioxide into the areas needing treatment. Quite simply, carbon dioxide therapy introduces additional oxygen into the affected areas, and the net result is a tightening of the skin with an improvement in facial wrinkles and loose skin in other areas of the body.

Doctor Nach notes that his patients are thrilled by the multiple benefits they have observed. This treatment can be performed on the face, neck, abdomen, thighs, and arms and anywhere that loose skin occurs. Although several weeks of treatment are required, Dr. Nach states, "Results are often apparent from the first treatment and become even better over time."

Doctor Nach practices as an Ear, Nose and Throat, Head and Neck surgeon and offers an array of minimally invasive rejuvenation procedures.

For further information and detailed medical descriptions of the procedure please contact the office of Dr. Raphael Nach of visit www.drnach.com .
